

MEYLE stabiliser links:

Same product, same durability, new colour

In order to use **fewer resources such as paint and water** across the entire production process, thus making a contribution to environmental sustainability, we have now decided to switch to the **cathodic dip painting (CDP)** process. Our MEYLE stabiliser links, which were previously galvanised in silver, are the first product group to be converted to cathodic dip painting, which has the side effect of giving them a black colour whilst retaining the same item numbers. The first stabiliser links with new paint are expected to be delivered **from Q2/2021** onwards.

A look at the label reveals whether it is the new version. Further information is available via QR code.

Item photos are marked 'Black or Silver'.

We provide support with:

- Uniform item numbers
- Communication via MEYLE channels
- Highly visible sticker and seal on MEYLE box
- Text module for database
